

# Truly Ergonomic Mouse, the HandShoe Mouse

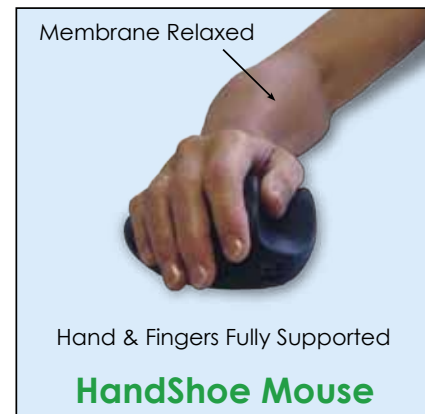

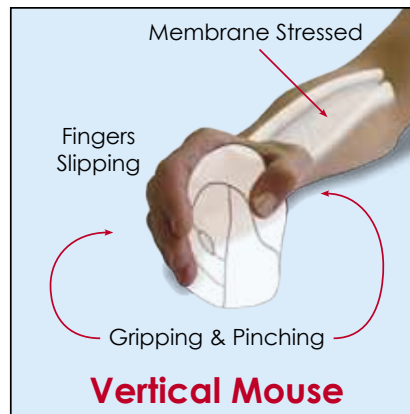

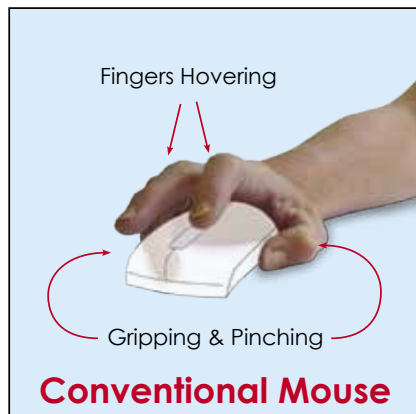

The Only Mouse That Fits like A Glove

However excellent the functionality of the **standard computer mouse** - we all use it with great ease - most of the time it is **too small** for the hand while its shape forces your hand and fingers in an unnatural gripping position. It lacks comfort and the **gripping and pinching**, as well as the **hovering** of your fingers above the mouse buttons are the major sources of complaints which may lead to Repetitive Strain Injury (RSI) or Carpal Tunnel Syndrome.

The Research team has also tested a **vertical mouse** and found that **gripping and pinching of a vertical mouse** is still a potential source of RSI or Carpal Tunnel Syndrome. Another medical university found that with a vertical mouse the "**interosseus membrane**" is **extremely taut ("stressed")** which also may lead to complaints.

The HandShoe Mouse was developed with all complaints in mind. Support of your hand and fingers prevents gripping and pinching and your arm is supported at the ideal angle of 25-30 degrees which makes sure your forearm is completely relaxed. So, you will understand that the HandShoe Mouse is the latest technology in the Evolution of the computer mouse as shown here:

## Evolution of the Mouse

### This is why the HandShoe Mouse is different:

1. Based on proper medical university research and extensive field testing
2. Your hand, thumb and fingers are supported in the best, relaxed position
3. There is no friction between the skin of your hand and the desk top
