

Have you ever considered Up-time of staff ?

The PC is part and parcel of our daily life work environment. Nearly everybody works with keyboard and mouse, often many hours a day. This often results in complaints in neck, shoulders, arms and hands which even translates into absence from work. In general the standard mouse does not fit the hand, it is either too small or too large and requires excessive muscle action to control.

It is from this perspective that the University Medical Center of Rotterdam (Erasmus MC) and the University Medical Center of Maastricht (the Netherlands) looked into the possibility to provide a mouse to prevent these complaints. After both fundamental and field research the HandShoeMouse was developed based on Bio-Design. It is the only true ergonomic mouse which realises minimal muscle exertion because the hand is fully supported and relaxed.

Do you value the productivity of your staff ?

When you provide your staff with tools to allow them to work in a relaxed fashion, they will have a more positive job experience and thus productivity will increase. That is exactly what the HandShoeMouse will create for you:

A relatively small investment will add to a substantial added value for the company. The risk of absence from work as a result of complaints mentioned will substantially reduce.
